

Challenge: Add a Phase

access

Challenge: Add a Phase

- Use example/Training/T02_01_FeCMn_D_DeltaGamma_2D_TQ.dri as template.
(Save as *Workspace/FeCMn.dri* and set output location *MyResults/FeCMn*)
- Add "Cementite" as third phase.
- Start Micress and interactively add all missing phase-specific input.
Use arbitrary values for phase properties, phase interaction, diffusion, ...
(Primary target is to get the driving file operational at all. Don't worry about details.)
- Add a spherical cementite grain with a diameter of 30 microns in the domain center.
(Look for traces of the melting cementite grain in *phas, *conc1 and *conc2.)

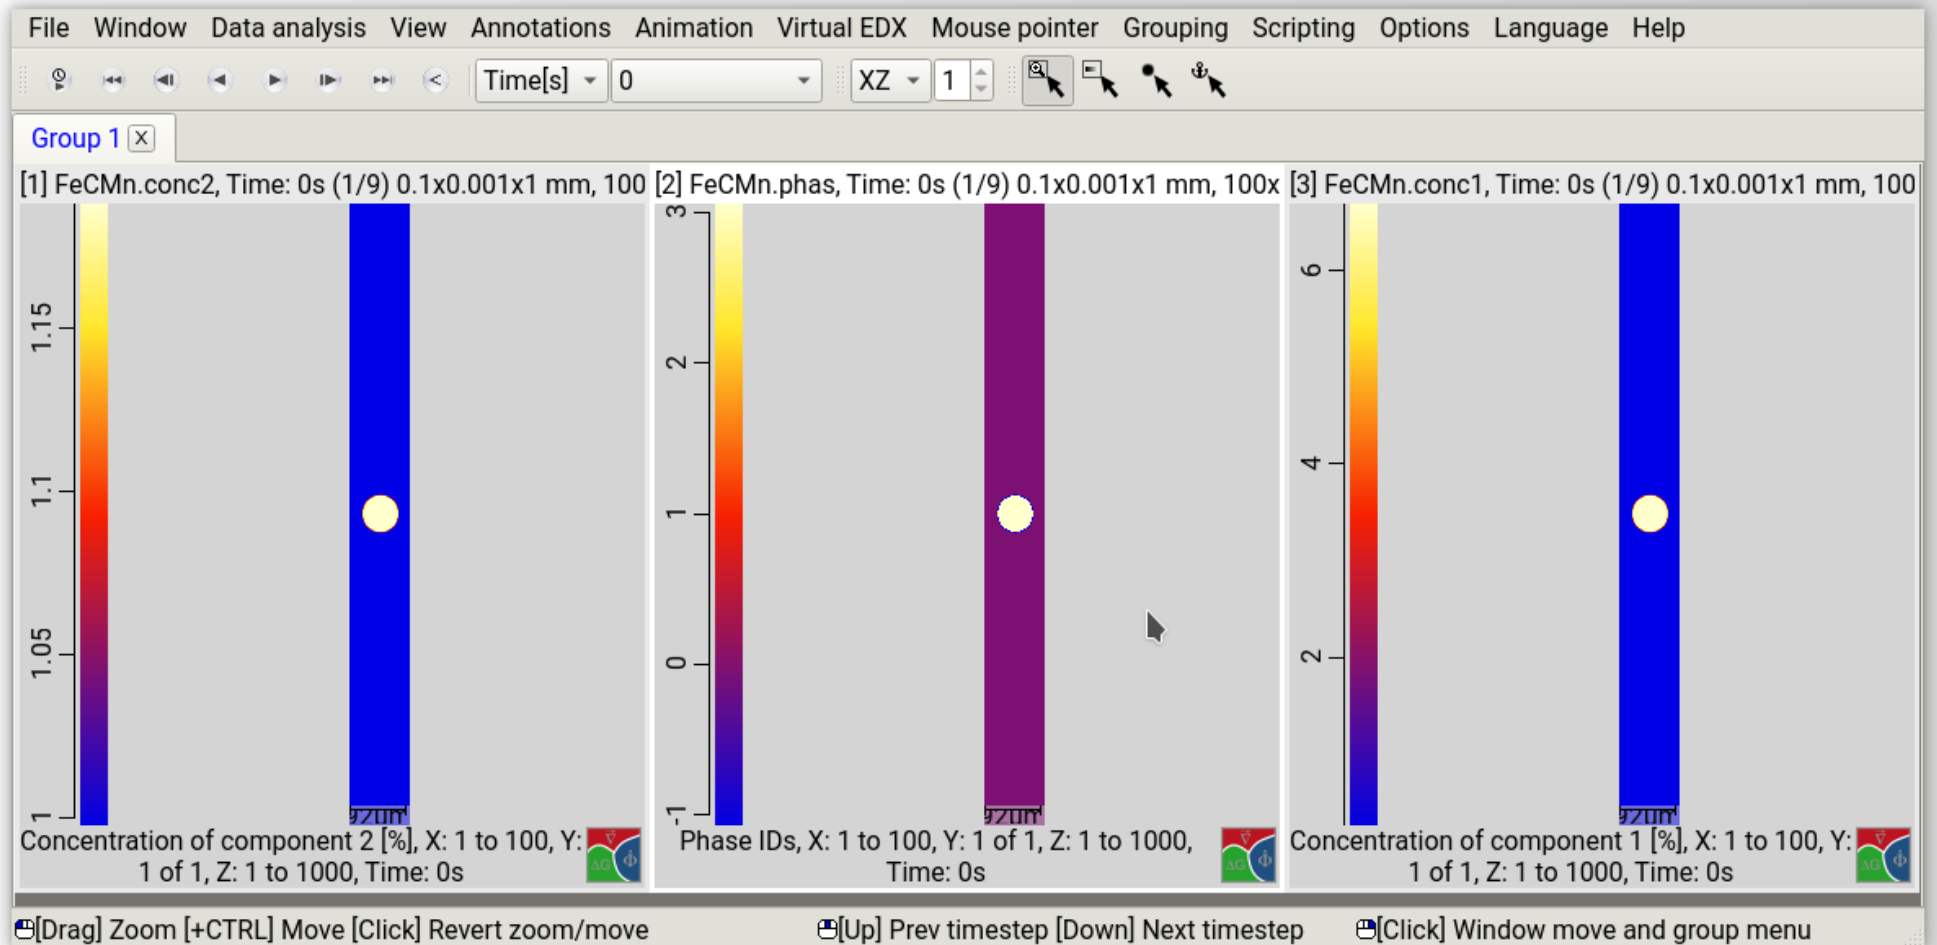

Optional:

- ☐ Find linearized thermodynamic parameters for Liquid/Cementite intercation in output *log.
